

Lab – Preparations

Introduction

In the Infrastructure course there are multiple hands-on exercises.

For these exercises we are using a Linux distribution (Debian) as a Virtual Machine.

Because it isn't really a good idea to start downloading these resources with 30 students in a classroom on the same wifi access point, we ask you to do the downloading up front at home. During the first practical lab, we will do the installation.

Downloads

We need you to download three tools to your laptop:

- Virtual Box
- the HvA Debian virtual machine
- Wireshark

In all cases, be aware of the operating system on your laptop, since there are different files for different OSses. You can use one of the following OSses:

- Windows
- MacOS
- Linux

Virtual Box

Go to the website: <http://www.virtualbox.org/>, click on the big Download button in the middle, and select your OS under **VirtualBox 6.X.Y platform packages**. Use the latest available version.

Figure 1

HvA Debian VM

The HvA Debian VM (Virtual Machine) is on the DLO website:
<https://dlo.mijnhva.nl>

Login in using your HvA account, go to the Infrastructure course (you might need to enroll first), then go to Content -> Practical labs and get the DebianHvAvX.Y.ova.

Figure 2

Wireshark

Last but not least: www.wireshark.org. Click on Download, select the best 64-bits version for your OS. At least for Windows or MacOS.

Figure 3

Unfortunately for Linux it's a bit more complicated: go to www.wireshark.org/docs/, read 2.1 and 2.2 and then 2.6.X, depending on what version of Linux you are using.

Installation

Once all these tools are downloaded successfully, we will install them. The instructions for that are in next week's lab.
