

Lab – Software installation

1. Introduction

In the Infrastructure course there are multiple hands-on exercises.

For these exercises we are using a Linux distribution (Debian) as a Virtual Machine.

This is part 2 of the instructions. Before you can perform these, you need to have done the previous 'Lab –preparationss'.

2. Software

We will be installing the software packages that we downloaded in the previous lab:

- Virtual Box
- the HvA Debian virtual machine
- Wireshark

In all cases, be aware of the operating system on your laptop, since there are different files for different Operating Systems. You can use one of the following OSs:

- Windows
- MacOS
- Linux

3. Virtual Box

The basic installation of VirtualBox is quite simple. Just start the file that was downloaded in the Preparations lab and click Next until it's done.

Figure 1

In case of trouble

There are a few issues that occur regularly:

- on a PC, make sure that Virtualisation Technology is enabled in your BIOS. This is not always the case by default
- on a Mac, you may need to allow software from Oracle America Inc in your security and privacy settings.

If that doesn't give the result you're hoping for, you can either use Google or YouTube to find the correct information.

4. HvA Debian VM

Next step is to load the DebianHvA virtual machine into the VirtualBox.

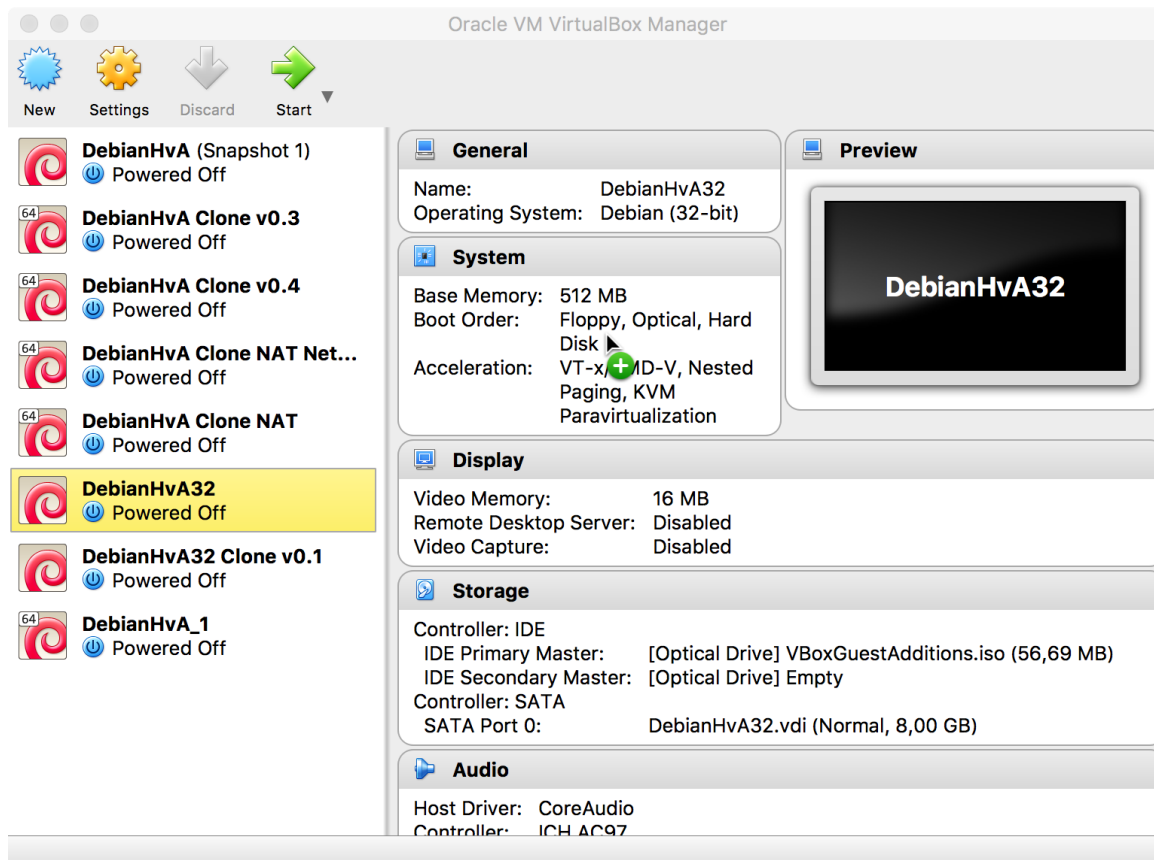

To get this done, start the VirtualBox application, and from the menu choose File and 'Import Appliance...'. This will give you a wizard from which you'll have to choose the DebianHvAvX.Y.ova file (which is probably in your Downloads folder).

Figure 2

Click Continue and then Import, that will take a while. When that's done, your VirtualBox application will look something like this (with probably just one DebianHvA32 virtual machine, aka. VM, at the left site):

Next step, to start the virtual machine DebianHvA, click 'Start'.

In the DebianHvA32 screen that will appear, it shows a 'login' prompt.

You can login using userid: 'student' with password 'HvA_student'. When necessary (but that will come later in the course) you can also use userid 'root' with 'HvA_root' as password.

When logged in successfully, this part is done.

5. Wireshark

For the installation of WireShark, double click the file you downloaded before and follow instructions. Make sure to say yes when asked to install Npcap or WinPcap ! Follow further instructions.

Figure 3

In case of trouble

If Wireshark does not capture packages, check that you did install the Npcap or WinPcap capture library and also set it to run on startup.

Otherwise: Google is your friend! And so is your teacher.. ;-))

6. Done

Once these tools are successfully installed, you're done with this part. There is another small lab where we will try out the applications we installed here.
